OUR REF: SNEU14052022

To whom it may concern,
STAS NETWORK PROJECT

Benefits of the project:

1. Real-time management of all economic activities in the country (tax collection, pay to and from the population without delay, integration of the citizens outside the country into the system of taxes and duties).
2. The costs of integrating and developing an e-Government solution with “stas network” digital-financial platform
3. The “stas network” digital-financial platform is the only one on the international market that has **"zero marginal costs"** and can give absolute and real time control to the Government on the technical solution, guaranteeing the development of a proprietary electronic financial card transfer and transfer to the Government
4. Integration can be done by developing the National Interactive Center for the database, integrating the solution with a future bank, and developing it for the dual currency
5. Developing the digital society and integrating it into the third digital industrial revolution.
6. The opportunity of developing a co-financing Trust Fund for European projects both for private and public-private projects.

The main sectors of digital e-government solution implementation and integration of e-government solution are:

- A. Tax collection in UTIL and real time by local governments, government, and payment to the population of state obligations
- Electronic identity card with e-TAX attached fee account.

The main purpose of the project is to allow the government and the local authorities to collect in REAL TIME the local taxes so that municipalities may have at their disposal the financial resources for current projects APPROVED FOR THE NEXT FINANCIAL YEAR.

-This project will also lead to the possibility of employing more than 50,000 young people graduating from high school or college at the national level, or a staff transfer from the administrative structure to develop a new type of paying agent and tax collection – the new PERSONAL FINANCIAL CONSULTANT for citizens in both rural and urban areas.

-the development of the new type of technologies

-integration of the principles of development of the digital society in all administrative and economic activities. This will reduce the use of cash and costs for the government for their payments to the citizens.

-support of companies and entrepreneurs for the continuous development and attraction of funds through the development of Public-Private Projects.

The project will be able to offer a full control in real time for the government for all the local payments and also for all the international transfers by offering its own “money transfer” platform with no commission only for a low monthly fee.

For the development of the e-Government project, we identified the need for 4 accounts required for each citizen or economic entity. These accounts are attached to the following solutions:

- Tax in a tax account
- Account of fines and payments
- Social, health and social insurance account
- Payment account P2P, P2B, P2G

Our company can develop the integrated solution for a financial platform that can be instrumental in managing in real time till 1,000,000,000 accounts with zero marginal costs to the transfer of funds into the system. This will reduce the current State's high cost to third parties for income, payments, payrolls, pensions, allowances, transfers of money in the country and abroad and many others and will no longer pay to VISA and Master Card.

The Internet of Things strategy and the current economic reality is to be able to have an integrated digital platform with Zero Marginal Transfer costs between accounts!

A full presentation of the project can be done by request and to evaluate the integration and development of the project costs.

Yours,
Florin Suciu
